Mobility impact assessment in L3Pilot

- Goal was to identify mechanisms and possible outcomes for mobility change
- L3Pilot is unique: It has data from the **general public** and **pilot site participants**, who had first-hand experience with automated driving

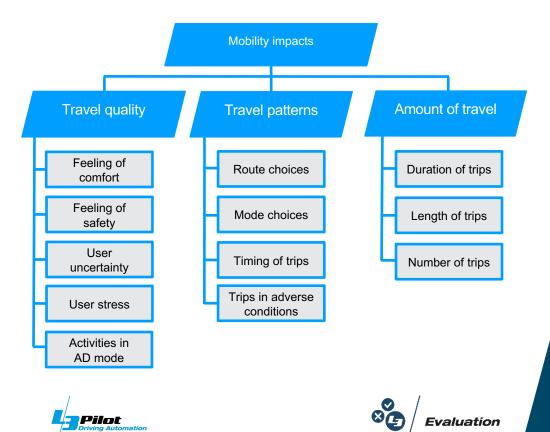

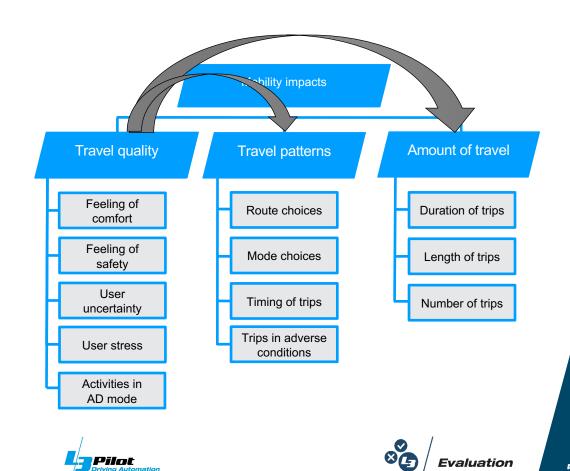

Research questions and framework

- What is the impact of ADFs on quality of travel?
- What is the impact of ADFs on travel patterns?
- What is the impact of ADFs on amount of travel?

Research hypotheses

- Use of conditional automate cars will change travel quality
- Changes in travel quality influence travel patterns and amount of travel

Main data sources

Pilot site data – views of pilot participants

- User questionnaires from the pilot sites and from the WIVW simulator study
- Focus groups providing further insights
- Survey data views of the general public
 - Impact assessment survey (n = 8,432 within Europe during 2021)
 - User and acceptance survey (= Annual survey) (n = 9,118 within Europe during 2019–2021)

Impact assessment survey – expectations

Respondents expected that conditionally automated cars will have neutral to ۲ positive impact on the quality of travel

My travel comfort 46% 30% Q: Considering your travel behaviour My risk of being involved in an accident 10% 19% 50% 15% 6% described in the 7% 3% previous questions, Certainty of reaching my destination as planned 21% 59% how do you think conditionally 11% 22% My stress of travelling 16% 44% automated cars would affect it? My productive use of travel time 52% 27% ■ Decrease greatly ■ Decrease slightly ■ Stay the same ■ Increase slightly ■ Increase greatly

7%

12%

Impact assessment survey – activities

- Respondents are willing to engage in non-driving related activities, especially leisure activities
- Similar results in the L3Pilot use and acceptance survey: 42% of the respondents would like to use the time for secondary activities

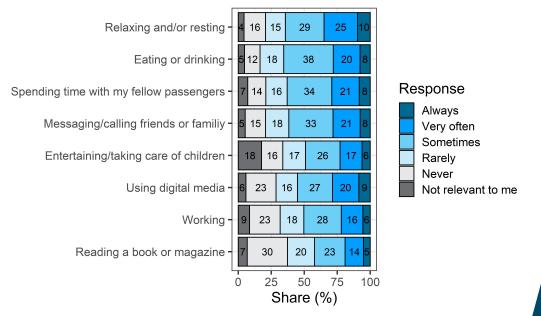

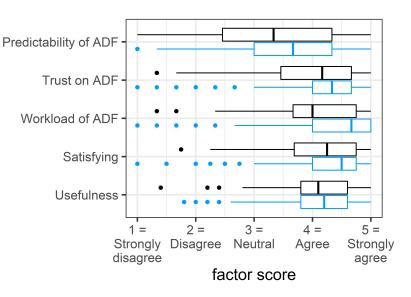

Figure. Activities the respondent would like to perform when driving in an automated mode with ADFs (n=8432).

Pilot sites – participants' views

- ADF experience was mostly positive
 - Predictability of ADF
 - Trust in ADF
 - Low workload of ADF
 - van der Laan's Satisfying and Usefulness scales
- Also pilot site participants were willing to engage in activities when driving in AD mode

Impact assessment survey – expectations

Personal car use may increase, and public transport use decrease

Q: Considering your travel behaviour described in the previous questions, how do you think conditionally automated cars would affect it?

	0%	20%	40% 60%		80%		100%	
My personal car use during peak hour	s 6% 119	%	58%	58%		17%	8%	
My personal car use (in genera	l) <mark>6%</mark> 9%		56%		20%		10%	
My public transport us	e 12%	17%		56%		11% 4		
My use of active travel modes	s 5 <mark>%</mark> 10%	b	64%			16%	6%	

■ Decrease greatly ■ Decrease slightly ■ Stay the same ■ Increase slightly ■ Increase greatly

Figure: Expected impacts on travel patterns based on L3Pilot's impact assessment survey (n=8432).

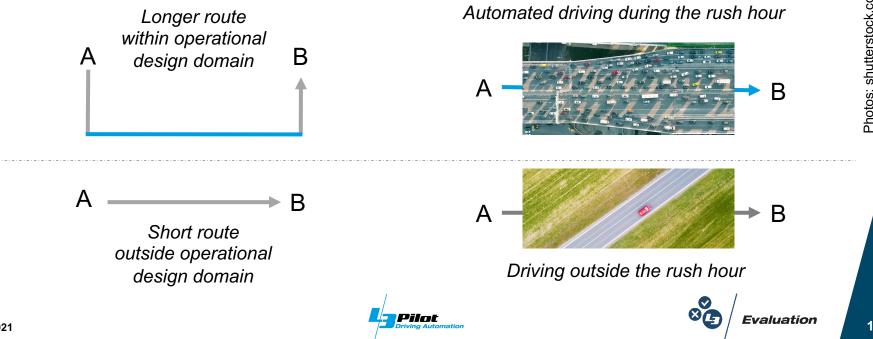

General public

Additional time accepted

 Survey respondents and pilot site participants were asked if they would accept additional travel time in two scenarios: longer route and congestion

General public

Pilot sites

Baseline

Pilot sites

Alternative scenarios

- Over 90% of the respondents were willing to accept longer travel times if they would not need to drive themselves
- 13–33% longer travel times in median → Estimated value of travel time savings between 12% to 25%
- Some travellers will switch to routes within ODD even if they were longer
- Rush hour travel by car becomes more acceptable

	Scenario	Baseline trip (min)	Accept longer travel times (%)	Median (min)	Median (% of baseline)	
Pilot site questionnaire – Motorway	Longer route	30	93	10	33%	
	Congestion	30	91	10	33%	
Pilot site questionnaire – Urban	Congestion	30	93	10	33%	
Impact assessment survey	Longer route	30	90	10	33%	
	Longer route	120	91	20	17%	
	Congestion	30	95	4	13%	
	Congestion	120	91	20	17%	

Impact assessment survey – expectations

Figure. Expected impacts on amount of travel based on L3Pilot's impact assessment survey (n=8432).

Pilot site participants' expectations

- 78% would use ADFs on their current trips
- 25% would make more car trips with ADFs
- 37% would make
 longer car trips with
 ADFs

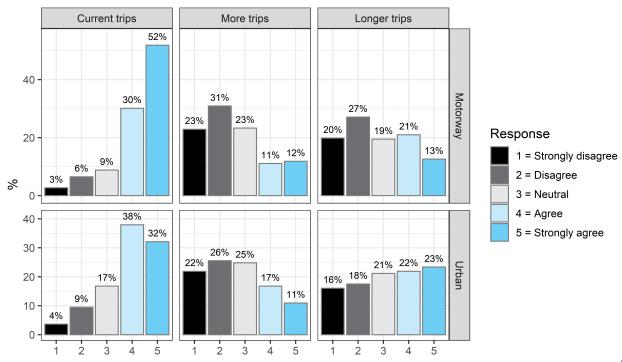

Figure. Pilot site participants' willingness to use ADF on their current trips, and expectation to travel more trips or longer trips once ADF is available (n=262 motorway and n=137 urban).

Most important predictors* based on the pilot site data

Significantly different from zero - No - Yes

Would make longer trips Would make more trips Would use on current trips Leisure activities · Usefulness Satisfying g Trust on ADF Work activities . Predictability of ADF . Low workload of ADF Would travel more if easier ⊢∙ Darkness · Fatigue UTN Lack of time · Traffic jams (timing) . Traffic jams (mode choice) Bad weather Traffic jams (route choice) ----Self-parking · Lane departure warning Blindspot monitoring · ADAS Parking assist Lane keeping assistance · Forward collision warning CC/ACC · • Low price F Comfort Short time Age -Other Car driving frequency Urban pilot · H Gender: Female -• -0.1 0.0 0.1 0.2 0.3-0.1 0.0 0.1 0.2 0.30.1 0.0 0.1 0.2 0.3 estimate

Factors influencing mobility with conditionally automated cars

LinkedInL3Pilot

Scaling up of the mobility impacts

- Scaling up estimated the potential for change in vehicle km travelled (VKT)
- Scaling up was based on
 - Estimated changes in the value of travel time
 - **Travel time change** estimated in L3Pilot efficiency and environmental impact assessment simulations
 - Increase in kilometres due to increased travel opportunities
- Changes in the above variables were translated by considering the penetration rates and elasticity coefficients derived from the literature

Scaled-up mobility impacts

- Car kilometres are predicted to increase
- Value of travel savings and penetration rate are the main determinants
- Dynamic feedback loops are not considered: e.g., more traffic → more congestion → car travel becomes less attractive

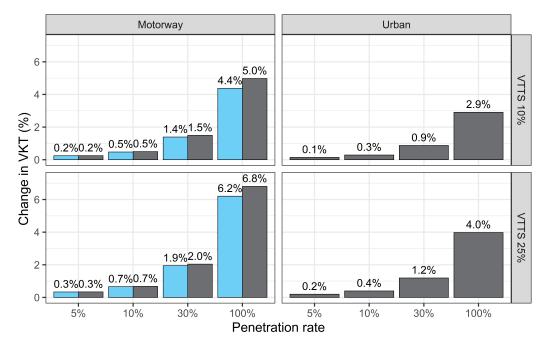

Figure. Estimated changes in car VKT due to conditional automation at different penetration rates for the motorways and urban roads.
